HOW IT WORKS

Multiple studies have proven that Evive uses Pulse Wave Therapy to repair aged blood vessels, stimulating growth of new blood vessels and removing decades of micro-plaque. The applied pulse circulates within the tissue and has a therapeutic effect on the targeted areas. This simple treatment provides you with an easy, non-invasive option with no downtime, and lasting results.

Benefits of Evive

- > Longer lasting erections
- > More spontaneous erections
- > Stronger, fuller erections
- > Relief from symptoms of Erectile Dysfunction and Peyronie's Disease
- > Enhanced sensitivity
- > Improved sexual performance
- > Decreased recovery time between orgasms

Performance

Proven to increase blood flow to the penis and optimize erections, sensitivity, and sexual performance.

Safety

No expensive pills with side effects or pre-planning required, and no risk for men with health conditions that prohibit other therapies.

TREATMENT

Erectile function is driven by the level of blood flow to the penis. By using pulsed acoustic waves to open existing blood vessels and create new blood vessels, Evive offers the latest revolution in men's sexual wellness. Evive treatment is performed in a series of simple in-office procedures that are completely non-invasive, drug-free, and surgery free.

Be sure to ask your provider if Evive treatment is right for you.

In 6 to 12 sessions each taking between 15 to 20 minutes, Evive treatments:

- > Stimulate the release of growth factors in penile tissue
- > Generate new blood vessels
- > Break up plaque formation in existing blood vessels
- > Activate dormant stem cells, leading to new cell growth

WHY EVIVE?

Real Results

Long-lasting results in treating erectile dysfunction and Peyronie's Disease by increasing blood flow and nerve tissues.

Simplicity

Non-invasive, in-office procedure uses high frequency, low intensity sound waves without surgery or use of any drugs.

"Pulsed wave therapy is a tremendous asset to my practice. It is the most effective treatment modality that I use to treat patients suffering from chronic pain unrelieved by traditional conservative treatments." — Dr. M. Cunha

Erectile Dysfunction

For many years, men with Erectile dysfunction (ED) have resorted to expensive medications to provide temporary relief. But these medications don't target the root cause of most patients' ED and can often bring unwanted side effects. Evive uses pulsed acoustic waves to address the root cause of poor sexual performance for men - poor blood flow. By expanding existing blood vessels in the penis and creating new avenues for more blood to flow into the penis, Evive allows you to experience healthier, fuller and more sustained erections.

Peyronie's Disease

Peyronie's Disease (PD) is a condition where scar tissue (plaque) develops under the skin surface of the penis causing it to bend or curve during erections. It can cause significant pain and sexual dysfunction in men. Evive provides a breakthrough solution addressing all aspects of PD. Research shows that acoustic wave therapy can be a safe and effective treatment in treating the symptoms of PD. It has shown considerable progress in reducing pain as well as eliminating the scar tissue and plaque buildup that contributes to PD.

Sexual Wellness

More than 50% of men over the age of 40 experience some form of decreased erectile function. The leading cause of erectile dysfunction is poor blood flow to the penis, which causes softer erections, inability to achieve an erection or unsustained blood flow that leads to men prematurely losing their erections during sex. Evive offers a non-invasive treatment to help improve sexual performance, allowing you to maintain a healthy and active sex life without interruption in sexual function.

WHAT IS EVIVE?

Evive offers a safe, comfortable and proven treatment option to optimize male sexual performance and reverse the effects of ED due to poor blood flow.

Evive uses non-focused sound waves (which diffuses as it travels away from the applicator tip) creating a therapeutic effect as it passes through the target tissue. Men benefit from improved blood flow to the penis by opening existing blood vessels and stimulating the growth of new blood vessels, without the use of injections or expensive medications.
